AMCOG

RISC OS is a compact and unencumbered operating system that runs on the 32-bit ARM processor. It was originally developed by Acorn Computers Ltd, the same company that first designed the ARM CPU itself, for use in the Archimedes range of computers – successors to the 8-bit BBC Micro and its variants.

The RISC OS North computer show is your opportunity to explore the operating system's history, and to see where it is now and where it's heading; to find out about the latest hardware and software developments from a range of companies and organisations operating in and for the RISC OS community.

If you would like to exhibit at the show, please send an email to:
